An Introduction to Optimization with Applications in Machine Learning and Data Analytics Jeffrey Paul Wheeler, 2023-12-07 The primary goal of this text is a practical one Equipping students with enough knowledge and creating an independent research platform the author strives to prepare students for professional careers Providing students with a marketable skill set requires topics from many areas of optimization The initial goal of this text is to develop a marketable skill set for mathematics majors as well as for students of engineering computer science economics statistics and business Optimization reaches into many different fields This text provides a balance where one is needed Mathematics optimization books are often too heavy on theory without enough applications texts aimed at business students are often strong on applications but weak on math The book represents an attempt at overcoming this imbalance for all students taking such a course The book contains many practical applications but also explains the mathematics behind the techniques including stating definitions and proving theorems Optimization techniques are at the heart of the first spam filters are used in self driving cars play a great role in machine learning and can be used in such places as determining a batting order in a Major League Baseball game Additionally optimization has seemingly limitless other applications in business and industry In short knowledge of this subject offers an individual both a very marketable skill set for a wealth of jobs as well as useful tools

for research in many academic disciplines Many of the problems rely on using a computer Microsoft s Excel is most often used as this is common in business but Python and other languages are considered The consideration of other programming languages permits experienced mathematics and engineering students to use MATLAB or Mathematica and the computer science students to write their own programs in Java or Python

Hypervolume-based Search for Multiobjective

Optimization Johannes M. Bader,2010-02-13 Most problems encountered in practice involve the optimization of multiple criteria Usually some of them are conflicting such that no single solution is simultaneously optimal with respect to all criteria but instead many incomparable compromise solutions exist In recent years evidence has accumulated showing that Evolutionary Algorithms EAs are effective means of finding good approximate solutions to such problems One of the crucial parts of EAs consists of repeatedly selecting suitable solutions In this process the two key issues are as follows first a solution that is better than another solution in all objectives should be preferred over the latter Second the diversity of solutions should be supported whereby often user preference dictates what constitutes a good diversity The hypervolume offers one possibility to achieve the two aspects for this reason it has been gaining increasing importance in recent years The present thesis investigates three central topics of the hypervolume that are still unsolved 1 Although more and more EAs use the hypervolume as selection criterion the resulting distribution of points favored by the hypervolume has scarcely been investigated so far Many studies only speculate about this question and in parts contradict one another 2 The computational load of the hypervolume calculation sharply increases the more criteria are considered This hindered so far the application of the hypervolume to problems with more than about five criteria 3 Often a crucial aspect is to maximize the robustness of solutions which is characterized by how far the properties of a solution can degenerate when implemented in practice So far no attempt has been made to consider robustness of solutions within hypervolume based search
