

Part V: Pressure and Mixtures of Gases

The atmosphere is composed of many gases in different ratios, and all of them contribute to the total atmospheric pressure. Use the simulation to explore this relationship by testing combinations of heavy and light gases.

For each Test #, record your measurement and then make the prediction before moving on to the next row of the table.

Test #	Pressure Measurement	Pressure Prediction (greater than, equal to, less than, twice as much, half as much, etc)
1	100 Light particles =	Pressure for 100 Heavy Particles will be _____ the pressure from Test #1.
2	100 Heavy particles =	Pressure for 200 Heavy particles will be _____ the pressure from Test #2.
3	200 Heavy particles =	Pressure for 100 Light AND 100 Heavy particles will be _____ the pressure from Test #3
4	100 Heavy + 100 Light particles =	Pressure for 200 Heavy AND 100 Light particles will be _____ the pressure from Test #4.
5	200 Heavy + 100 Light particles =	Pressure for 150 Heavy AND 50 Light particles will be _____ the pressure from Test #5.
6	150 Heavy + 50 Light particles =	<i>Write your own prediction:</i>

The Three Sisters Ying Wu, John J. Carroll, Yongle Hu, 2019-05-21 This is the seventh volume in the series *Advances in Natural Gas Engineering* focusing on carbon dioxide CO₂ capture and sequestration acid gas injection and enhanced oil recovery the three sisters of natural gas engineering This volume includes information for both upstream and downstream operations including chapters detailing the most cutting edge techniques in acid gas injection carbon capture chemical and thermodynamic models and much more Written by some of the most well known and respected chemical and process engineers working with natural gas today the chapters in this important volume represent the most state of the art processes and operations being used in the field Not available anywhere else this volume is a must have for any chemical engineer chemist or process engineer in the industry *Advances in Natural Gas Engineering* is an ongoing series of books meant to form the basis for the working library of any engineer working in natural gas today

Gas Accretion onto Galaxies Andrew Fox, Romeel Davé, 2017-03-23 This edited volume presents the current state of gas accretion studies from both observational and theoretical perspectives and charts our progress towards answering the fundamental yet elusive question of how galaxies get their gas Understanding how galaxies form and evolve has been a central focus in astronomy for over a century These studies have accelerated in the new millennium driven by two key advances the establishment of a firm concordance cosmological model that provides the backbone on which galaxies form and grow and the recognition that galaxies grow not in isolation but within a cosmic ecosystem that includes the vast reservoir of gas filling intergalactic space This latter aspect in which galaxies continually exchange matter with the intergalactic medium via inflows and outflows has been dubbed the baryon cycle The topic of this book is directly related to the baryon cycle in particular its least well constrained aspect namely gas accretion Accretion is a rare area of astrophysics in which the basic theoretical predictions are established but the observations have been as yet unable to verify the expectations Accretion has long been seen around the Milky Way in so called High Velocity Clouds but detecting accretion even around nearby galaxies has proved challenging its multi phase nature requires sensitive observations across the electromagnetic spectrum for full characterization A promising approach involves looking for kinematic signatures but accretion signatures are often confused with internal motions within galaxies Accretion studies therefore touch a wide range of astrophysical processes and hence a wide cross section of the astronomical community As observational facilities are finally able to access the wavelength ranges and depths at which accretion processes may be manifest the time is right to survey these multiple lines of investigation and determine the state of the field in accretion studies of the baryon cycle

Thermodynamic Models for Process Simulation Jean-Charles de Hemptinne, Jean-Marie Ledanois, 2012 The selection of the most adequate thermodynamic model in a process simulation is an issue that most process engineer has to face sooner or later This book conceived as a practical guide aims at providing adequate answers by analysing the questions to be looked at The analysis first chapter yields three keys that are further discussed in three different chapters 1 A good understanding of the properties required in the process and their method of calculation is the first key The second chapter provides to that end in a synthetic manner the most important equations that are derived from the fundamental principles of thermodynamics 2 An adequate description of the mixture which is a combination of models and parameters is the second key The third chapter makes the link between components and models both from a numerical parameterisation and physical molecular interactions point of view Finally 3 a correct view of the phase behaviour and trends in regard of the process conditions is the third key The fourth chapter illustrates the phase behaviour and makes model recommendations for the most significant industrial systems A decision tree is provided at the end of this chapter In the last chapter the key questions are reviewed for a number of typical processes This book is intended for process engineers who are not specialists of thermodynamics but are confronted with this kind of problems and need a reference book as well as process engineering students who will find an original approach to thermodynamics complementary of traditional lectures
