objects is found to be deflected by the gravitational field of massive objects near the line of sight an effect predicted by
Einstein in his first paper setting forth the general theory of relativity and confirmed by Eddington soon afterwards If the
source of the light is sufficiently distant and bright and if the intervening object is massive enough and near enough to the
line of sight the gravitational field acts like a lens focusing the light and producing one or more bright images of the source
This book by renowned researchers in the field begins by discussing the basic physics behind gravitational lenses the optics
of curved space time It then derives the appropriate equations for predicting the properties of these lenses In addition it
presents up to date observational evidence for gravitational lenses and describes the particular properties of the observed
