College Algebra John Coburn, Jeremy Coffelt, 2013-01-11 When Julie Miller began writing her successful developmental math series one of her primary goals was to bridge the gap between preparatory courses and college algebra For thousands of students the Miller O'Neill Hyde or M O H series has provided a solid foundation in developmental mathematics With the Miller College Algebra series Julie has carried forward her clear concise writing style highly effective pedagogical features and complete author created technological package to students in this course area The main objectives of the college algebra series are three fold Provide students with a clear and logical presentation of the basic concepts that will prepare them for continued study in mathematics Help students develop logical thinking and problem solving skills that will benefit them in all aspects of life Motivate students by demonstrating the significance of mathematics in their lives through practical applications

Arthur's Invariant Trace Formula and Comparison of Inner Forms Yuval Z. Flicker, 2016-09-14 This monograph provides an accessible and comprehensive introduction to James Arthur's invariant trace formula a crucial tool in the theory of automorphic representations It synthesizes two decades of Arthur's research and writing into one volume treating a highly detailed and often difficult subject in a clearer and more uniform manner without sacrificing any technical details The book begins with a brief overview of Arthur's work and a proof of the correspondence between GL_n and its inner forms in general Subsequent chapters develop the invariant trace formula in a form fit for applications starting with Arthur's proof of the basic non invariant trace formula followed by a study of the non invariance of the terms in the basic trace formula and finally an in depth look at the development of the invariant formula The final chapter illustrates the use of the formula by comparing it for G , GL_n and its inner form G and for functions with matching orbital integrals

Gröbner Bases Thomas Becker, Volker Weispfenning, 2012-12-06 The origins of the mathematics in this book date back more than two thousand years as can be seen from the fact that one of the most important algorithms presented here bears the name of the Greek mathematician Euclid The word algorithm as well as the key word algebra in the title of this book come from the name and the work of the ninth century scientist Mohammed ibn Musa al Khwarizmi who was born in what is now Uzbekistan and worked in Baghdad at the court of Harun al Rashid's son The word algorithm is actually a westernization of al Khwarizmi's name while algebra derives from al jabr a term that appears in the title of his book *Kitab al jabr wa l muqabala* where he discusses symbolic methods for the solution of equations This close connection between algebra and algorithms lasted roughly up to the beginning of this century until then the primary goal of algebra was the design of constructive methods for solving equations by means of symbolic transformations During the second half of the nineteenth century a new line of thought began to enter algebra from the realm of geometry where it had been successful since Euclid's time namely the axiomatic method

D-Modules and Spherical Representations Frédéric V. Bien, 2014-07-14 The theory of D modules deals with the algebraic aspects of differential equations These are particularly interesting on homogeneous manifolds since the infinitesimal action of a Lie algebra consists of differential operators Hence it is possible to attach geometric invariants like the support and the characteristic variety to representations of Lie groups By considering D modules on flag varieties one obtains a simple classification of all irreducible admissible representations of reductive Lie groups On the other hand it is natural to study the representations realized by functions on pseudo Riemannian symmetric spaces i e spherical representations The problem is then to describe the spherical representations among all irreducible ones and to compute their multiplicities This is the goal of this work achieved fairly completely at least for the discrete series representations of reductive symmetric spaces The book provides a general introduction to the theory of D modules on flag varieties and it describes spherical D modules in terms of a cohomological formula Using microlocalization of representations the author derives a criterion for irreducibility The relation between multiplicities and singularities is also discussed at length Originally published in 1990 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905

Geometric Algebra with Applications in Science and Engineering Eduardo Bayro Corrochano, Garret Sobczyk, 2011-06-28 The goal of this book is to present a unified mathematical treatment of diverse problems in mathematics physics computer science and engineering using geometric algebra Geometric algebra was invented by William Kingdon Clifford in 1878 as a unification and generalization of the works of Grassmann and Hamilton which came more than a quarter of a century before Whereas the algebras of Clifford and Grassmann are well known in advanced mathematics and physics they have never made an impact in elementary textbooks where the vector algebra of Gibbs Heaviside still predominates The approach to Clifford algebra adopted in most of the articles here was pioneered in the 1960s by David Hestenes Later together with Garret Sobczyk he developed it into a unified language for mathematics and physics Sobczyk first learned about the power of geometric algebra in classes in electrodynamics and relativity taught by Hestenes at Arizona State University from 1966 to 1967 He still vividly remembers a feeling of disbelief that the fundamental geometric product of vectors could have been left out of his undergraduate
