Random Processes with Applications to Circuits and Communications Bernard C. Levy, 2019-09-14 This textbook is based on 20 years of teaching a graduate level course in random processes to a constituency extending beyond signal processing communications control and networking and including in particular circuits RF and optics graduate students In order to accommodate today's circuits students needs to understand noise modeling while covering classical material on Brownian motion Poisson processes and power spectral densities the author has inserted discussions of thermal noise shot noise quantization noise and oscillator phase noise At the same time techniques used to analyze modulated communications and radar signals such as the baseband representation of bandpass random signals or the computation of power spectral densities of a wide variety of modulated signals are presented This book also emphasizes modeling skills primarily through the inclusion of long problems at the end of each chapter where starting from a description of the operation of a system a model is constructed and then analyzed Provides semester length coverage of random processes applicable to the analysis of electrical and computer engineering systems Designed to be accessible to students with varying backgrounds in undergraduate mathematics and engineering Includes solved examples throughout the discussion as well as extensive problem sets at the end of every chapter Develops and reinforces student's modeling skills with inclusion of modeling problems in every chapter Solutions for instructors included

Error Analysis with Applications in Engineering Zbigniew A. Kotulski,Wojciech Szczepinski,2009-12-10 Our intention in preparing this book was to present in as simple a manner as possible those branches of error analysis which nd direct applications in solving various problems in engineering practice The main reason for writing this text was the lack of such an approach in existing books dealing with the error calculus Most

of books are devoted to mathematical statistics and to probability theory The range of applications is usually limited to the problems of general statistics and to the analysis of errors in various measuring techniques Much less attention is paid in these books to two dimensional and three dimensional distributions and almost no attention is given to problems connected with the two dimensional and three dimensional vectorial functions of independent random variables The theory of such vectorial functions finds new applications connected for example with analysis of the positioning accuracy of various mechanisms among them of robot manipulators and automatically controlled earth moving and loading machines such as excavators
