

In an abrupt increase of load occurs when the engine is running at continuous rating, the engine speed falls. So the flyweights are moved inward and the tension lever pulled to left by the control spring, causing the control rack to move in the direction that fuel is increased.

At the time, the tension lever pin pushes the bottom of the torque control lever, and the lever moves with the pin "A" as the fulcrum, whereas the portion "B" is pushed to right. As the result, the torque spring performs the function of reducing movement of the tension lever.

#### (b) RFD type governor

The RFD type governor is a minimum-maximum governor which controls only the minimum and maximum speeds.

The RFD type governor make it possible to increase or reduce fuel by the load control lever which operates the control rod. Any desired speed can be set as a displacement of the speed control lever changes the tension of the governor spring.

Because of the construction described above, the RFD governor can be operated as an all-speed governor by holding the load control lever in the FULL position and operating the speed control lever.

On the top of the governor, an engine stop lever is provided which creates a no-fuel injection state for stopping the engine. A cancel spring is provided to make sure that when the lever is operated, no undue force is applied to the link.
