

Unit 5 Geometry

Introduction to Similar

Scale Factor

A **scale factor** is a type of transformation that makes a figure larger or smaller without changing its shape.

The corresponding sides of an image and a preimage may be used to find the scale factor.

Consider a right triangle with legs of length 3 and 4, and a hypotenuse of length 5. If the scale factor is 2, the new triangle will have legs of length 6 and 8, and a hypotenuse of length 10.

Try Example

How do you determine if two triangles are similar?

Step 1: Check if the triangles are similar.

Step 2: If they are, find the scale factor.

Step 3: Use the scale factor to find the missing side lengths.

Triangle Inequality Theorem

Definition: For the inequality, you will need a compass and a ruler. Although you can use a ruler to measure, using a compass and a ruler is more accurate. You can also use a compass to construct a triangle with given side lengths.

Step 1: Construct a triangle with side lengths of 3 cm, 4 cm, and 5 cm.

Step 2: Use a ruler to measure the length of the longest side.

Construct a triangle with side lengths of 3 cm, 4 cm, and 5 cm.

Use a ruler to measure the length of the longest side.
